

## No longer assumed

~~weak selection~~  
**any strength now**

~~isolated populations~~  
**gene flow among them**

~~one optimum everywhere~~  
**optima differ by place**

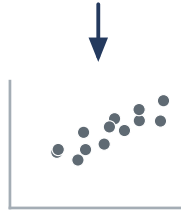

dashed: what the likelihood assumed

## Simulate instead

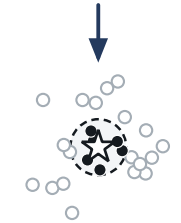

approximate Bayesian computation (ABC)

**draw parameters**  
from their priors

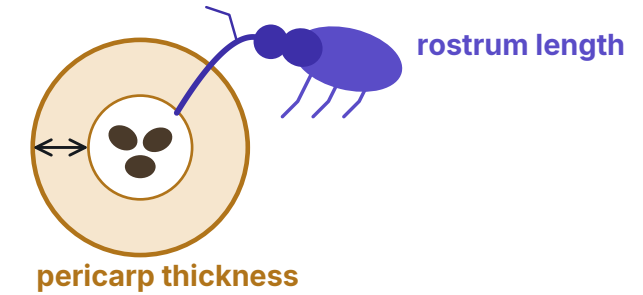

**simulate the data**  
with those parameters

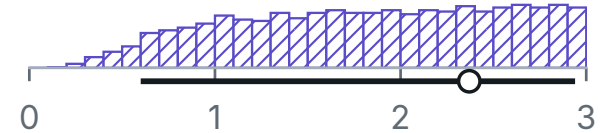

**keep the draw**  
if its data are close to ours

close: five summaries within tolerance  
(two means, two spreads, one correlation)

## A camellia and its weevil

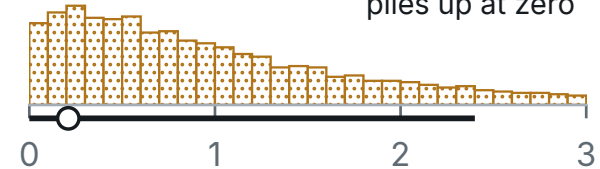

**selection on the weevil**  
above zero

**selection on the camellia**

piles up at zero

**Support for coevolution; but one-sided evolution cannot be ruled out**
