

Coevolution, place by place

coevolution

strengths B_1, B_2

abiotic selection

strengths A_1, A_2

drift

finite populations

the same forces at every location,
a different history at each

The likelihood

predicted pattern against observed pattern

$$P(\text{data} \mid \theta)$$

what the model predicts

↓ read as

$$L(\theta \mid \text{data})$$

the likelihood

θ : all the parameters,
 $B_1, B_2, A_1, A_2, \delta$

A likelihood, and a test

coevolution: $B_1, B_2 \neq 0$

likelihood-ratio tests: coevolution is supported
only if both one-sided models are rejected
