

SAME SCALE

species with species

1

classical pairwise coevolution

*the interface sets the outcome
across space: who is ahead depends on distance*

4

within one guild

strong competitors select strongly

2

a species and its guild

one link sits among many

3

between two guilds

the web around the link

8

hosts and microbiomes

microbes have a geography of their own

5

host and microbiome

genes and microbes build the trait

7

host and microbe

a microbe can buffer, or speed adaptation

6

host and inherited symbiont

what selection reaches is what responds

DIFFUSE

many partners

INTIMATE

one partner, often inherited

NESTED

a host with its microbes
